

2D Tire Rack Supervise System

The 2D Tire Rack Supervise System (TRSS) is an extension to the 2D Tire Monitoring System (TMS).

It uses the sensors mounted on each wheel (WUS) for presenting the status of all tires in a rack system in the paddock. Information presented:

- tire temperature
- tire air pressure
- battery status of WUS (ok/low)

You can enter different parameters for each type of tire (wet, dry, front, rear) and handle one or more rider on one or different PCs.
